

FIBERGLASS POOL

Start-Up Instructions

Congratulations, your swimming pool has a new fiberglass surface! You may already know that fiberglass is one of the easiest pool surfaces to maintain and has the highest tensile strength of any of the interior surface materials. It is also one of the most durable surfaces and can withstand water conditions that would destroy other types of interior finishes.

If the installers haven't already started filling the pool, they will leave instructions as to when you should turn on the hose. Continuously fill the pool until it reaches the middle of the skimmer. Once the pool is full of water, start the pool equipment and adjust the calcium hardness until it reaches at least 300 ppm. Once that has been accomplished, adjust the pH to 7.2 to 7.4, the total alkalinity to 100 to 120 ppm, and the chlorine to 1.0 to 1.5 ppm and then install the pool sweep and you're done. Fiberglass does not require any brushing during the start-up period.

Feel free to contact our office or your job superintendent with any questions.
